Fires highlighted in yellow have submitted a final ICS-209

Evening Brief

Date/Time Stamp: Thursday, June 29, 2017 - 9:20 PM

Weather Summary

...High Risk for Wind Today across Parts of Utah...

Winds will shift to the W-NW behind the cold front today and Friday and remain breezy across the eastern half of the Great Basin today, but speeds will decrease from yesterday with gusts around 30 mph but continued very low RH 5-10%

Friday into the weekend will see a gradual warming and drying trend across the area, though there is the potential for isolated thunderstorms across the north again on Saturday and Sunday. Otherwise light to moderate winds are expected through the holiday weekend, with a slight increase in winds Saturday/Sunday across southern Nevada/southern Utah as a weak trough of low pressure moves through the area. Isolated thunderstorms may also return to the higher elevations of Utah Sunday into early next week as the trough moves through.

Preparedness Levels

Current:

Great Basin	3
National	3

Great Basin Fire Activity: Light Activity

New Fires and Acres: 14 fires for 1,117 acres. 10,956 acres large fire growth.

Resources:

- Crews: 21 T1 IHCs in GB, 16 committed, 3 Available and 2 R&R.
- T1 IMT Team 2 Martin and T2 IMT Team 4 Roide Committed to Brianhead fire.
- Local IA resources are at drawdown for UT and NV.
- GBCC has committed an estimated 83 type 3, 4, 6 engines.
- 0-T1 and 4-T2 helicopter are available in GACC.

Great Basin Fire Potential Summary

Fine fuels, which have been the main contributor to fire spread early this season in the north, continue to dry out quickly across the Great Basin especially in areas that have remained very dry in the west/south. Higher than normal fine fuel loading and continuity exists over the northern half of the Great Basin. ERCs have now climbed to the 90th-97th percentile over southern NV/UT and the AZ Strip, with more advanced fire behavior on ongoing fires in southern Utah.

Lower elevation grasses are cured over the southern 2/3 of the Great Basin, and are in various states of curing across Idaho/Wyoming. South slopes and low elevations are experiencing the fastest curing in the grasses during the recent warm and dry period. Live fuel moisture is still near to above normal across the northern 2/3 of the Great Basin, but is on the downward trend.

For more detail, see Great Basin 7-Day Fire Potential Outlook
